

# Welfare regime patterns in the social class-fertility relationship: second births in Austria, France, Norway and United Kingdom

*Pau Baizan*

ICREA  
and Universitat  
Pompeu Fabra

# Background

- Little previous research
- Class refers to categories of individuals who share similar positions in **labor market**
- Class as a major basis for the distribution of **life course chances and risks, and employment conditions**
- My hypothesis: **Class has predictable effects on:**
  - economic security
  - employment-parenthood role compatibility
  - gender equality

# Employment regulation

- Class positions derive from **employment relations** (Goldthorpe 2000)
- Regulation of the employment contract is different for each social class
- 1) **Control & monitoring the work of employees**
- 2) **Degree of specificity of the skills**
  - **professionals-managers**: “**service**” relationship. High skill specificity & monitoring difficult. Long-term prospects, high autonomy
  - **Intermediate occupations**: **mixed** relationship
  - **Unskilled jobs**: **basic** labor contract: Low skill specificity & monitoring easy. Short-term relationship, little autonomy

# Employment regulation

- Labor market relationships generate class inequalities:
- **Positive relationship between class and...**
- **Economic security** : job stability, exclusion from labor market, motherhood penalty, income,...
- **Role compatibility**: access to parental leave, affordability of formal childcare, time flexibility, work control
- **Gender equality**: linked to role compatibility, intra household inequalities, job precarity and lower motherhood penalty lead to housewife model (low class)

# Welfare regime

- Institutional context should modify the effect of class on fertility...
- ...with different effects by social class
- Welfare regime shapes class inequalities:
  - wage differentials (systems of collective bargaining)
  - access to welfare state income support,
  - access to service provision (childcare)
  - deregulation & employment (in-)security,
  - segmentation (fix-term jobs),
  - maternity/paternity leave,
  - levels of unemployment,
  - rights to flexible working hours,
  - standard work day
  - Family benefits, taxation

# Hypotheses: UK and Austria

- *U-shaped relationship between class and second birth probabilities*
- Manual & lower service workers :
  - *Male breadwinner/ female carer model*
  - *low role compatibility*
  - Little penalization from leaving the labor market (no career jobs)
  - UK: *re-entering the labor market easy*, high child benefits, low employment security & wages
  - A: *explicit familialism*, long parental leaves + part-time jobs, socially stratified incentives, tax/cash benefits proportionally larger for low income groups, strong internal labor markets
- Middle & high classes:
  - Positive relationship: economic security, role compatibility, gender equality
  - Strong inequalities in access to formal childcare & time flexibility

# Hypotheses: France and Norway

- *Positive relationship between class and second birth probabilities*
- Positive social gradient in economic security, role compatibility, & gender equality
- *High levels of role compatibility*, but diversified household models by class
- State support to (temporary) female carer model: parental leave
- *Low wage differentials*
- N: Little labor market precarity & exclusion. High economic security for all
- F: Labor market precarity leads to low fertility (temporary jobs, unemployment)

# Data

- European Union Statistics on Income and Living Conditions 2004-15
- Panel survey: 2 to 4 waves (years) for each woman + retrospective data
- Fertility: date of birth of each child present in household
- Women age 15-45
- 2<sup>nd</sup> births
- European Socio-economic Classification ESeC

# European Socio-economic Classification household ESeC

	<b>France</b>	<b>Austria</b>	<b>Norway</b>	<b>UK</b>
Higher professionals & administrators	0.205	0.169	0.331	0.293
Lower professionals & administrators	0.197	0.164	0.219	0.129
Higher grade white collar workers	0.245	0.185	0.154	0.167
Small employers & self employed	0.033	0.032	0.018	0.038
Lower services	0.155	0.254	0.163	0.208
Skilled manual workers	0.059	0.082	0.053	0.027
Semi & unskilled manual workers	0.077	0.065	0.028	0.068
Never worked & long term unemployed	0.026	0.036	0.022	0.060
(Missing or student with no previous job)	0.004	0.012	0.010	0.009

# Techniques

- Discrete –time **event history analysis**
- Time to 2<sup>nd</sup> birth
- Logistic regression

$$Y_{ij}^* = \beta_0 + \beta_1' X_{ij} + \beta_2' X_{ij} + u_{ij}$$

# Norway

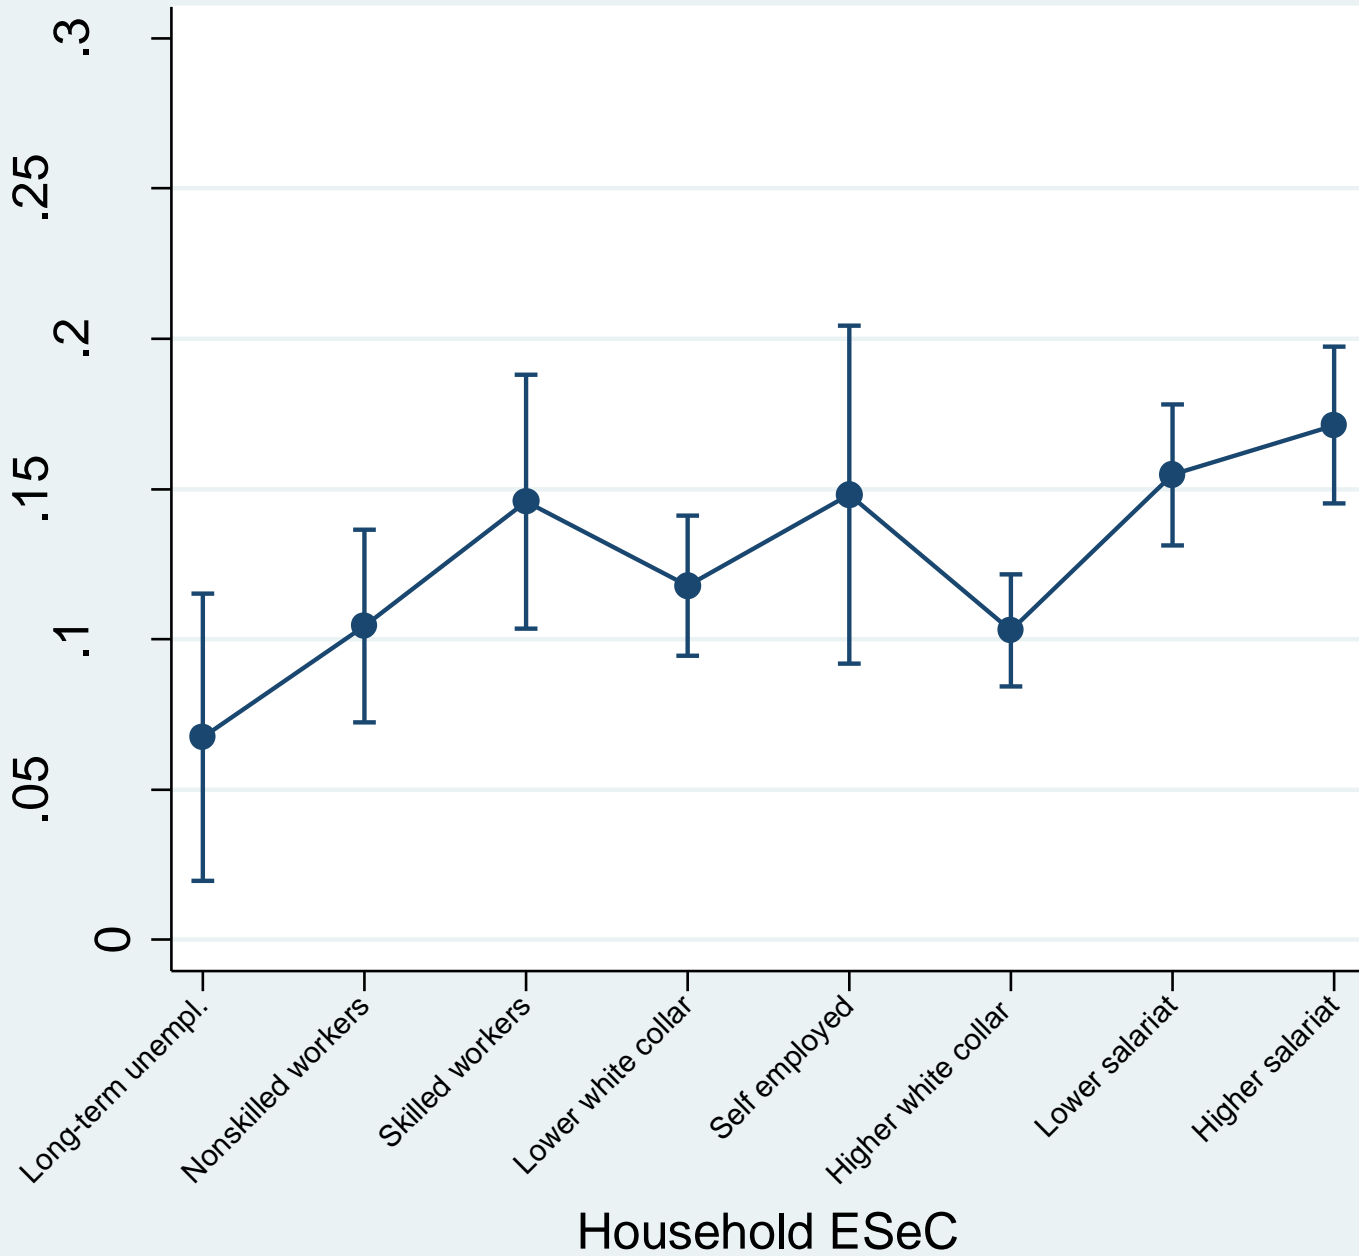

# Norway

# France

# France

# Conclusions

- **Class theory** and **welfare regime** theory provide a framework to interpret fertility:
  - Socio-economic differentials
  - International differentials
- Key role of employment regulation in explaining class differentials in:
  - **Economic security**
  - **Role compatibility**
  - **Gender equality**
- Social class provides a link between **macro level** (labor market regulation & employment relations, class inequalities) and **micro level** behavior (fertility)

# Conclusions

- Results show substantial differentials between social classes
- Distinct patterns have emerged for each country studied
- The results consistent with hypotheses
- Welfare regime features interact with individuals' social class positions in explaining fertility levels (overall and social differentials)
