No. 370  
JULY-AUGUST 2001

## The population of the world (2001)

Gilles Pison \*

Every other year, the summer issue of *Population & Sociétés* presents a global picture of the world population. The data shown here can be found in the *World Population Data Sheet* published by the Population Reference Bureau (PRB) [1]. Each year, this independent organization provides synthetic data sheets using figures obtained from different sources, mainly the United Nations Population Division [2], the United States Census Bureau, the Council of Europe and... INED [3], which endeavours to assemble all the demographic data published by national statistics agencies and international organizations.

### ◆ The indicators and their quality

The data shown in the central data sheet concern all geopolitical entities with a population of 150,000 or more and a few others. Sovereign states are listed along with non-sovereign territories, among which France's overseas departments. Countries and territorial entities are listed following the United Nations' system of classification per region and continent.

The demographic indicators are for the most part the same as those used in earlier editions: land area, mid-2001 population estimate, birth and death rates, population projection for 2025, infant mortality rate, total fertility rate, percentage of population under 15 and over 65, male and female life expectancy at birth. To these, one must add an economic indicator developed by the World Bank, the Gross National Income (formerly called Gross National Product) per capita adjusted for purchasing power parity (GNI PPP); the difference between this indicator and the traditional "Gross National Income per capita" is explained in the box below. A new column was added this year to the *World Population Data Sheet* and reproduced here, indicating the proportion of persons with HIV/AIDS among the adult population aged 15 to 49, according to

UNAIDS data. These figures include persons who are suffering from AIDS as well as those who have been infected by the virus but are not yet ill. Finally, the last column provides an indicator of data availability, in four categories. The countries rated "A" are developed countries with complete vital statistics and regular census-taking or population registers. The total population of these countries is 1.5 billion. The countries rated "B", which include four of the most populous countries (China, India, Indonesia, Brazil) represent the largest share of the world population — 4.4 billion. Those rated "C", among which the most populated are Pakistan and Nigeria, represent about 480 million; those marked "D" are mostly countries where no census has been conducted following recent disruptions or conflicts (Afghanistan, Angola, Congo, Burma, Yugoslavia, etc.), a population totalling 177 million.

Fifteen smaller tables classify countries or geopolitical entities according to several indicators, following a downwards scale. In the first eight tables, a world total is given and a line separates the countries totalling more than half of the world figure. For instance, the six most populated countries (the four mentioned above in addition to the United States and Pakistan) represent a total population of 3.1 billion, or more than half of the world population, estimated at 6.1 billion.

## Notes

• **World and regional totals.** Regional population totals are independently rounded and include small countries or areas not shown in the table. Regional and world rates and percentages are weighted averages of countries for which data are available; regional averages are shown when data are available for at least three quarters of the region's population.

• **The tables** taken from the *World Population Data Sheets* should **not be used as a time series**. Fluctuations in values from year to year often reflect revisions based on new data or estimates rather than actual changes in levels. Additional information on likely trends and consistent time series can be obtained by consulting publications of the organizations listed above.

• **Area.** This refers to the "land area" or "total area" of the country, excluding area under inland water bodies, i.e. major rivers and lakes. Variations are due to updates

and revised data provided by the countries and do not necessarily reflect an actual change in the country's area. The PRB used the data provided by the last *FAO Production Yearbook*.

• **Population mid-2001.** Estimates are based on a recent census, official national data, or UN and U.S. Census Bureau projections. The effects of refugee movements, large numbers of foreign workers and population shifts dues to contemporary political events are taken into account to the extent possible. Such events can lead to a high degree of uncertainty in the estimates.

• **Data availability code.** The data availability code provides a general indication of data availability. An "A" indicates a country with both complete vital statistics (births and deaths) and either a national-level census within 10 years or a continuous population register.

If a country has complete vital statistics or a continuous population register and a

national-level census within 15 years, they are rated "B". Also rated "B" are countries that have one of the three sources necessary for an "A" plus either a usable national survey or a sample registration system within 10 years.

"C" indicates that at least a census (within 15 years), a survey (within 10 years), or sample registration system is available.

"D" indicates that little or no reliable demographic information is available and that estimates are based on fragmentary data or demographic models. Countries whose demographic situations have been seriously disrupted and for which there are few recent data are also coded "D". There can be considerable variation in the quality of data within the same category.

• **GNI PPP.** This is Gross National Income converted to US dollars using a purchasing power parity (PPP) factor (see box); this indicator is not available for all the countries.

### What does a dollar buy ?

#### Gross National Income per capita adjusted for purchasing power parity

This year, instead of the traditional Gross National Income (GNI) per capita (formerly called Gross National Product, or GNP, by the World Bank), the large central Data Sheet provides the Gross National Income per capita adjusted for purchasing power parity (GNI PPP). The PRB explains the difference in these terms [1]: “GNI is the total value of all goods and services produced within a country plus net income earned abroad by nationals. GNI PPP refers to gross national income converted to “international” dollars using a purchasing power parity conversion factor. International dollars indicate the amount of goods or services one could buy in the United States with a given amount of money. GNI PPP provides an indicator of the welfare of people that is comparable across countries free of price and exchange rate distortions that occur when GNI is converted using market exchange rates.

Many interesting comparisons result from the use of PPP. In India, for example, GNI per capita is a low US\$440, but, when adjusted for purchasing power, it rises considerably to US\$2,230, a result of the lower cost of goods and services in India relative to the United States. In other words, US\$440 in India would buy purchases worth US\$2,230 in the United States. GNI PPP is nearly always higher than the GNI in less developed countries. However, Japan and many countries in western Europe have higher costs of living than in the United States. As a result, their GNI PPP is lower than GNI converted at market exchange rates. Note that because the U.S. dollar is the standard currency on which PPP is based, GNI and GNI PPP for the United States are the same value in the table above”.

*Comparison of Gross National Income and Gross National Income in PPP, 1999 (per capita, US dollars)*

Country	GNI	GNI PPP
Brazil	4 350	6 840
China	780	3 550
Ethiopia	100	620
India	440	2 230
Indonesia	600	2 660
Japan	32 030	25 170
Nigeria	260	770
Russia	2 250	6 990
Switzerland	38 380	28 760
United States	31 910	31 910

Note: Gross National Income refers to the value of all goods and services produced within a country plus net income earned from abroad by nationals. Gross National Income in Purchasing Power Parity refers to the amount of goods and services that GNI would buy in the United States.

The following table provides a comparison of the two indicators for selected countries.
